

SALT CHECK

Salt Water Determination Test Kit

SALT/FRESH WATER CHECK is specifically intended to identify the nature of water (fresh or salt) found in lubricating or fuel oil. The simple test procedure helps to provide such important information as the probable source of the leakage or ingress. Once the nature of water in oil is determined, further actions can be taken more efficiently.

Features:

- Measuring range: go / no go
- Measuring time: about 10 min.

Benefits:

- Quick to apply
- Only one reagent is necessary
- Accurate test results
- Easy to use even for untrained personnel

In order to define whether salt is present in water or not, the indicator pad is pricked with a needle several times. The excreted Solution W is applied on the pad with a pipette. The eventually occurring color change of the indicator pad after a few minutes proves whether the water in oil has salty nature or not. Besides it is possible not only to determine the salt water content in oil, but also to roughly define vol. % of salt contamination based on certain experience with this test method.
